Aim and motivation for work

- Unpublished industrial data show that the oscillatory baffled crystallizer (OBC) allowed nucleation without seeds, whereas the stirred tank crystalliser (STC) must be seeded to produce crystals under comparable operating conditions
- Aim of the research is to seek scientific explanations to this phenomenon by probing into nucleation mechanisms using sodium chlorate as the model compound

EPSRC

Centre for Innovative Manufacturing
in Continuous Manufacturing and Crystallisation

EPSRC

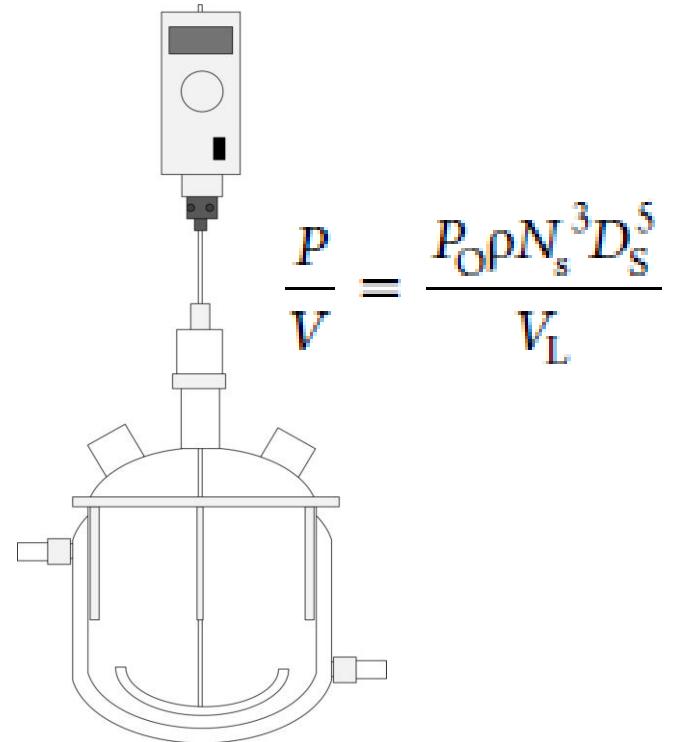

Engineering and Physical Sciences
Research Council

Experimental set up & calibration

- An OBC (500 mL) and a STC (500 mL)

$$\frac{P}{V} = \frac{2\rho N_b}{3\pi C_D^2} \left(\frac{1 - \alpha^2}{\alpha^2} \right) \alpha_o^3 (2\pi f)^3$$

$$\frac{P}{V} = \frac{P_O \rho N_s^3 D_S^5}{V_L}$$

Oscillatory Baffled Crystallizer

- Uniform mixing and improved heat/mass transfer
- Increased specific surface areas, allowing easy temperature control
- Readily scaled up

EPSRC

Stirred tank crystallizer

- Strong mixing at impeller tips dissipated quickly
- Heat/mass transfer constraints due to ineffective mixing overall
- Complex scale up

Experimental set up & calibration

- The basis and the methodology
- Previous research showed that nucleation mechanism could retrospectively be related to handedness of product crystals¹

Product analysis

- Polarimetry enables analysis of crystal enantiomorphism

- This is the methodology used throughout the study
- On average 3100 crystals per run were analysed and counted
- Triplet runs for each condition

EPSRC

Centre for Innovative Manufacturing
in Continuous Manufacturing and Crystallisation

EPSRC

Engineering and Physical Sciences
Research Council

Procedure

- Solution saturated at 31 °C (approximately 10 M NaClO₃ solution)
- Solution cooled to 30 °C
- Supersaturation at $\Delta T = 1$ is approximately 1.02
- On reaching 30 °C, solution seeded with single seed crystal for 3 minutes suspended on metal wire
- Seed withdrawn and mixing stopped
- Crystals developed overnight and analyzed

EPSRC

Results and discussions

Benchmark tests

Test 1 – With NO mixing as well as NO stirrer and baffles in both a STC and an OBC

100 % similarity to the seed was obtained

Test 2 – With NO mixing, but with the presence of stirrer and baffles in both a STC and an OBC (add Test 3 with the wire only)

100 % similarity to the seed was obtained

EPSRC

Results and discussions

Benchmark tests

Test 3 – With mixing, but only a blank metal seed wire was immersed in the solution

No crystals were obtained

Summary 1 – no primary nucleation was found to occur

With seed and with mixing in both a STC and an OBC

sample	P/V (Wm^{-3})					
	12		187		766	
	STC	OBC	STC	OBC	STC	OBC
1	100	94	100	99	100	93.2
2	100	95	100	93.4	100	93.1
3	100	96.3	100	92.9	100	98.3
Average	100	95.1	100	95.1	100	94.87
Standard Error	0	0.67	0	1.96	0	1.72

Summary 2

- Results found that the STC always gave crystals of the same form as the seed crystal.
- In the OBC, the product crystals were never 100 % similar to the seed, typically around 95 %.
- What has caused this production of the “*seed-dissimilar*” crystals in the OBC?

EPSRC

Centre for Innovative Manufacturing
in Continuous Manufacturing and Crystallisation

EPSRC

Engineering and Physical Sciences
Research Council

The OBC step up

- Baffles are tightly fitted to the column, the scraping action could be the main culprit

Tight fit baffle

- If this was true, the removal of it from the OBC while adding it to the STC would cast some insights into this hypothesis

Loose fit baffle

EPSRC

Centre for Innovative Manufacturing
in Continuous Manufacturing and Crystallisation

EPSRC

Engineering and Physical Sciences
Research Council

The STC setup

- Scraping was introduced by simply lowering the impeller

EPSRC

Centre for Innovative Manufacturing
in Continuous Manufacturing and Crystallisation

EPSRC

Engineering and Physical Sciences
Research Council

Testing hypothesis of scraping

- When the gap was introduced in the OBC, similarities increased towards 100 %
- When the impeller was scraping the surface of the STC, *seed-dissimilar* crystals were generated.

	P/V (Wm^{-3})					
sample	12		187		766	
	STC	OBC	STC	OBC	STC	OBC
1	92.6	100	100	98.8	93.6	99.6
2	94.6	97.0	99.0	99.5	96.3	99.8
3	99.7	99.9	92.2	98.7	97.3	99.0
Average	95.6	99.0	97.09	99.0	95.76	99.5
Standard Error	2.1	1.0	2.4	0.2	1.1	0.2

Nucleation rate of seed-dissimilar crystals

- The number of crystals obtained in each experiment is known.
- Seeding was done for a fixed period of time for all tests before agitation was stopped, enabling a small number of large crystals.
- The nucleation rates could be evaluated from this information

EPSRC

Centre for Innovative Manufacturing
in Continuous Manufacturing and Crystallisation

EPSRC

Engineering and Physical Sciences
Research Council

For the Scraped OBC

Scraped	Amplitude (mm)		
Sample	7	15	30
1	97.84	98.11	93.2
2	100	95.68	90.5
3	99.92	98.43	93.1
Average	99.25	97.41	92.27
Standard error	0.71	0.87	0.88

Increasing amplitude generated more opposite-handed crystals

EPSRC

Centre for Innovative Manufacturing
in Continuous Manufacturing and Crystallisation

EPSRC

Engineering and Physical Sciences
Research Council

For the un-scraped OBC

Un-scraped	Amplitude (mm)		
Sample	7	15	30
1	100	99.95	98.84
2	100	99.93	99.49
3	100	99.42	98.71
Average	100	99.77	99.01
Standard error	0	0.17	0.24

Once again, increasing amplitude generated more opposite-handed crystals, but effect is less pronounced

EPSRC

Centre for Innovative Manufacturing
in Continuous Manufacturing and Crystallisation

EPSRC

Engineering and Physical Sciences
Research Council

- The amplitude is related to the mixing via the Strouhal number (St)

$$St = D / (4\pi x_o)$$

- The nucleation rate of the *seed-dissimilar* crystals may be related to the Strouhal number, provided the other parameters remained unchanged and independent:

$$J' = K'(St)^m$$

- K' is the nucleation rate constant and m is the order

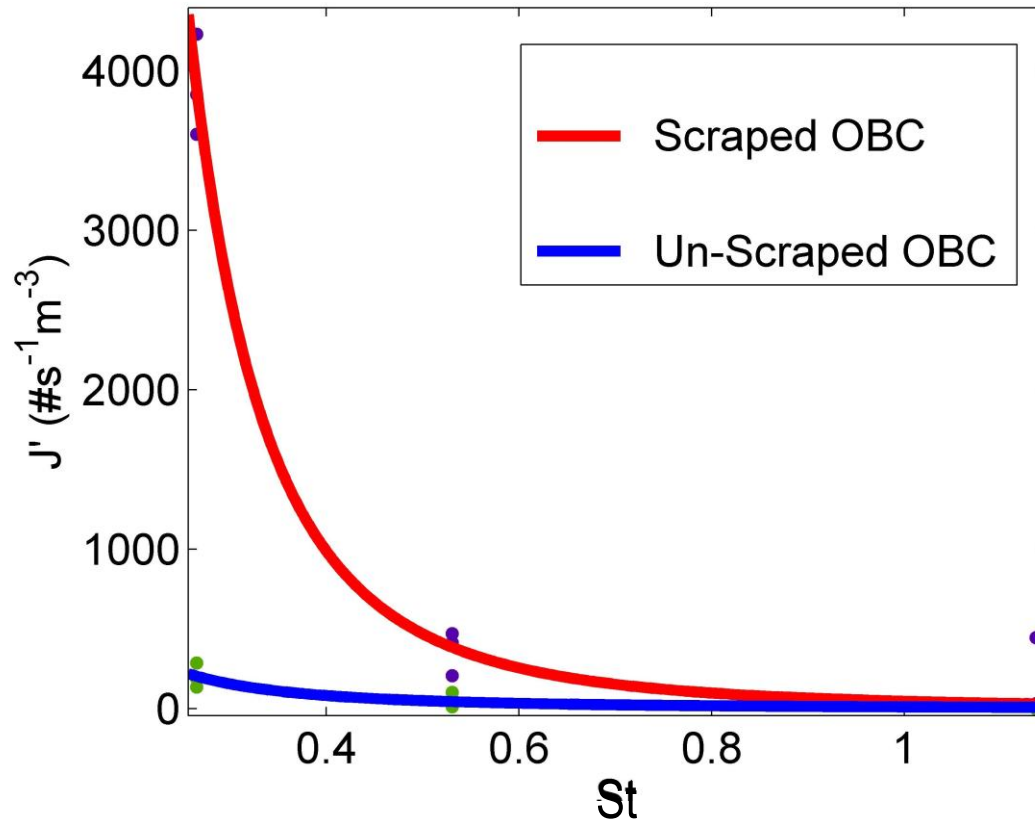

EPSRC

Centre for Innovative Manufacturing
in Continuous Manufacturing and Crystallisation

EPSRC

Engineering and Physical Sciences
Research Council

	Scraped	un-scraped
m	-3.3	-2.2
K'	46	11
r^2	0.98	0.8

Scraping gave much higher nucleation rate (around 10 x) than when scraping was not present

How to utilize the finding

Could this be utilised as a nucleation generator when integrated into a COBC?

EPSRC

Centre for Innovative Manufacturing
in Continuous Manufacturing and Crystallisation

EPSRC

Engineering and Physical Sciences
Research Council

Closing remarks

- In the OBC, scraping mechanism seems to be the main driver for the *seed-dissimilar* nuclei being formed
- When scraping is removed, the similarity to seed increases, but we still see the *seed-dissimilar* nuclei. Could this be due to internal surface renewal as a function of mixing?
- Shear forces in the seed crystal boundary layer may be another explanation
- Our next target is identifying what the nucleation mechanism is
